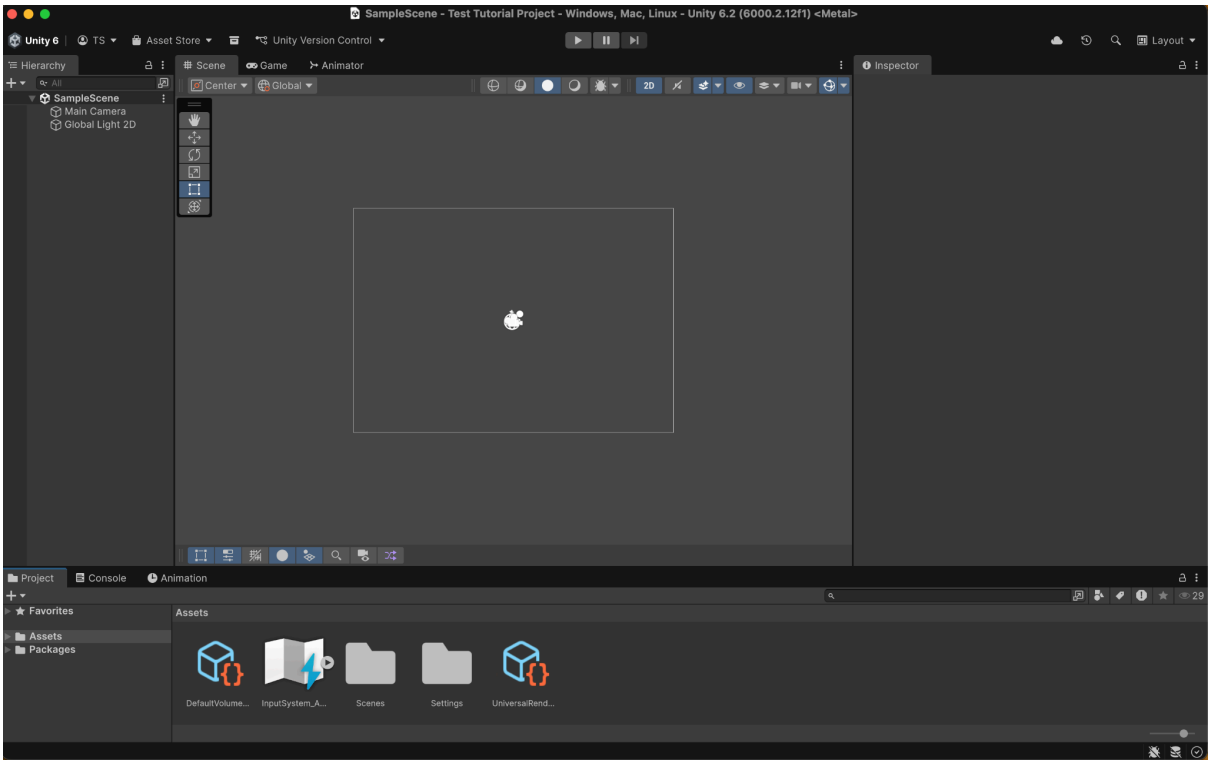
Hi guys, welcome to this Unity Tutorial! The formatting's a bit bare-bones, but I'll try to cover the basic things you'll want to know about Unity without absolutely word-vomiting concepts that you won't understand and probably won't need for a while.

So first of all, follow the instructions in the discord under the #unity channel to install Unity Hub and Unity, and set up an account. (I'm not gonna re-invent the wheel on this one, the tutorial posted there is very concrete and easy to follow).

Once you've done that, open up Unity Hub and click the 'New Project' button. For the current tutorial, we'll be doing a 2D game, so select the "Universal 2D" template option, name your project whatever you want, and select "Create Project". It's gonna take what will seem like an entirely unreasonable amount of time to load. When it's done, you'll be looking at something like this:



This might seem a bit daunting, but I'll quickly cover what all of these things do.

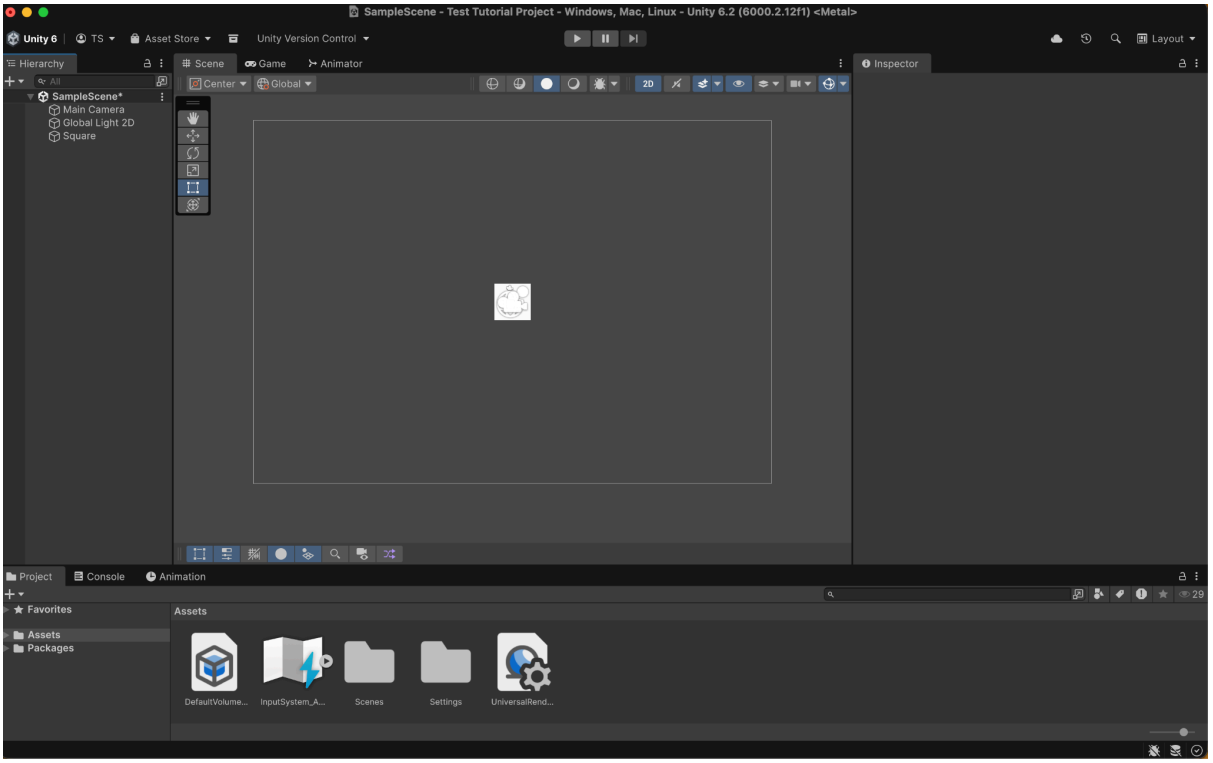
The play, pause, and beginning icon buttons in the middle of the top of the screen are, well, the "play game", "stop game", and "reset game to start" buttons, respectively. You'll use them to test your game. Right now, if you clicked them, you wouldn't see much, because there isn't anything in the scene (the game world) other than a camera and a light. We'll add some stuff later.

The "Assets" bar in the bottom is where you'll access files like sound bites, scripts, animations, prefabs, etc. Again, the stuff that's in there right now is just default stuff which I wouldn't recommend you change right now. The "Hierarchy" tab to the left shows all the stuff that currently exists in the scene, as opposed to the assets, which shows all stuff that is in the game folder, whether or not you actually have used it. The "Inspector" tab to the right is

something that lets you examine the components and settings of objects in your assets or your scene.

Now, everything in the scene is going to be what's called a "game object", which basically is, well, an object that exists in the game. They can be boxes, spheres, UI images, or even just empty, intangible entities with scripts attached to them. You can attach different components to these objects, move them around, activate and deactivate them during runtime, and create and destroy them. Let's create one now.

Hover over the "Hierarchy" tab with your mouse, and right click. A menu will appear. Navigate to 2D Object > Sprites > Square, and left click. A square object should appear in your Hierarchy. Your Unity screen should now look something like this:



Congrats! You made a square! This square will be our player, so name it "Player". This concludes this tutorial, but in the next one, we will add player movement, letting the square move around the screen.
